

INSTRUCTIONS FOR USING A ROUNABOUT

Roundabouts are different than traditional intersections and require some different driving techniques. Here are the steps to follow as you navigate a roundabout:

- 1. Slow down as you approach the roundabout** — 15-20 miles per hour is usually about right for driving in the roundabout, depending on its size.
- 2. Pick your lane.** Look for the lane-use signs as you approach the roundabout, choose your lane before entering the roundabout and **stay in it until you exit** the roundabout.
- 3. Yield.** When approaching the roundabout, always yield to pedestrians, bicyclists and vehicles **in all lanes** (the yield sign will show you where to yield).
- 4. Look left.** Vehicles in the roundabout have the right of way. If there is no traffic in the roundabout, don't stop. If traffic is present, wait for an opening and then enter.
- 5. Give way to large vehicles.** Allow large vehicles the extra turning radius needed to navigate the roundabout. Never pass or drive next to a large vehicle in the roundabout.
- 6. Emergency vehicles.** If you seen an emergency vehicle coming, exit the roundabout; don't pull over in the roundabout.

WHAT IS RCOC?

The Road Commission for Oakland County maintains Michigan's largest county road system, with more than 2,700 miles of public roads (including more than 700 miles of gravel roads). Only the state highway system is larger.

RCOC also maintains:

- ◆ Approximately 90 bridges,
- ◆ Approximately 1,500 traffic signals,
- ◆ Approximately 150,000 traffic signs and
- ◆ More than 230 miles of state highway.

SAFETY FIRST

As a matter of policy, major road improvement projects are conducted by the Road Commission based on a safety ranking system. At RCOC "Safety First" is more than a motto.

RCOC:

- ▶ Is separate from county general government and receives no direct revenue from property taxes.
- ▶ Receives the majority of its funding from the state and federal fuel taxes and the state vehicle registration fee.
- ▶ Has congested roads due to the tremendous growth in the county in past decades.
- ▶ Receives no direct revenue from economic growth and development.
- ▶ Pays \$2 million or more to pave a mile of gravel road.
- ▶ Pays \$7.5 million or more to widen one mile of road from two lanes to five.
- ▶ Is located in a state with a gas tax below the national average.
- ▶ Is located in a state that ranks in the bottom nine states in per capita state and local road funding -- and has for nearly 50 years.

BOARD OF ROAD COMMISSIONERS

RONALD J. FOWKES

GREGORY C. JAMIAN

ERIC S. WILSON

Dennis G. Kolar, PE
Managing Director

Gary Piotrowicz, PE, PTOE
*Deputy Managing Director
County Highway Engineer*

RCOC MISSION STATEMENT

RCOC strives to provide the public with leadership in:

- Safe and convenient roads
- Sound financial management
- Responsive and dependable service
- Respect for the environment
- Sensitivity to community concerns

MODERN ROUNABOUTS

The roundabout at the intersection of Livernois and Tienken roads Rochester Hills.

AN INTERSECTION DESIGN THAT IS:

- ▶ IMPROVING SAFETY
- ▶ ADDING CAPACITY
- ▶ ENHANCING AESTHETICS

ROUNDBABOUTS

The modern roundabout, a relatively new form of circular intersection, is an alternative to traditional signalized intersections. It was developed by traffic engineers in England, who, after a substantial amount of research, concluded that the roundabout is the safest, most efficient design for many intersections.

ROUNDBABOUTS ARE NOT TRAFFIC CIRCLES

Modern roundabouts are not the same as the traditional traffic circles that were built around the U.S. in the first two thirds of the 20th century. In fact, there are some significant differences:

- ▶ Traditional traffic circles: Traffic comes to a complete stop then makes a 90-degree turn into the circle.
- ▶ Roundabouts: Traffic merges into the circle at a more gradual angle, so vehicles don't have to come to a full stop, but simply yield & merge into traffic.
- ▶ Roundabouts are smaller than traffic circles, which reduces vehicle speed and the likelihood of accidents in the circle.

A traditional traffic circle

ROUNDBABOUTS IMPROVE SAFETY

Studies* indicate intersections converted from traffic signals to roundabouts result in:

- 90% fewer traffic fatalities
- 75% fewer injury crashes

The crashes that do occur tend to be much less serious and rarely fatal, because they are typically low-speed sideswipes and rear-end collisions rather than the head-on, left-turn and high-speed, broad-side collisions that occur at signalized intersections.

*Source: Insurance Institute for Highway Safety's "Status Report Vol. 40, No. 9."

In part, that's because roundabouts have fewer "conflict points" than signalized intersections -- these are the points at which vehicles can collide. The diagrams below show the potential conflict points for signalized intersections and roundabouts.

INCREASE ROAD CAPACITY 30-50%

- Continuous travel through the intersection, at a reduced speed, actually gets you there sooner than the stop and go of a traditional signalized intersection.
- Roundabouts at the intersections of two-lane roads can allow the two-lane roads to carry additional capacity, in some cases nearly as many cars as a four-lane road with traffic signals.

POPULAR WITH DRIVERS

Numerous studies nationwide have demonstrated that drivers like roundabouts. That has been the case locally as well.

A survey conducted by West Bloomfield Township reported that 66 percent of respondents were in favor of constructing additional roundabouts in the future.

ROUNDBABOUTS OFFER IMPROVED AESTHETICS

- Most people think roundabouts look nicer than traffic signals.
- Opinion surveys in Maryland, Colorado and Vermont found that 80-90 percent of area residents liked their new roundabouts.
- The central island can provide space for landscaping.

PEDESTRIAN CROSSINGS

Crossing at a roundabout is generally easier for a pedestrian than at a traditional signalized intersection. This is because in a roundabout, the pedestrian is only crossing one direction of traffic at a time.

Pedestrians should:

- Use the appropriate pedestrian crossing.
- Stay out of the center island.
- Look for exiting or entering traffic.
- Cross the exit or entrance lane to the "diverter" island which splits the

- entrance/exit lanes, and
- Then continue across. These diverter islands provide safe havens where pedestrians can wait for traffic to clear. In some instances, the Road Commission has provided pedestrian-crossing devices to aid pedestrians.
